-!- DOMAIN: Composed of three domains: a modulating N-terminal domain, a DAMA-binding domain and a C-terminal steroid-binding domain.
-!- PTM: Phosphorylated by cyclin A/CDK2 (By similarity).
-!- MISCELLANEOUS: In the absence of ligand, steroid hormone receptors are thought to be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor complex appears to receptor affinity. The hormone-receptor complex appears to receptor affinity. The sequences upstream of transcriptional start sites.
-!- SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                              J. Biol. Chem. 275:13510-13516(2000).
-!- FUNCTION: Nuclear hormone receptor. The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MGD; MGIL1352467; EST1.

SUBUNIT: Binds DNA as a homodimer. Can form a heterodimer with ESR2. Interacts with NCOA3 and NCOA6 coactivators, leading to a strong increase of transcription of target genes. Interacts with NCOA5. Binds UBEIC (By similarity).
                                                                                                                                                                                                                                                                                                                                          "Isolation and characterization of peroxisome proliferator-activated receptor (PPAR) interacting protein (PRIP) as a coactivator for

RA Furnel-Instance 1. Dong X., Bailey J.A., Reed C.A., Osborne E., Gize E.A., Ra Fundel-Instance 1. Dong X., Bailey J.A., Reed C.A., Osborne E., Gize E.A., Rix E.A., Bigsby R.M., Nephew K.P.; The standard cactivating enzyme of NEDDB inhibits steroid receptor function."; Mol. Endocrinol. 16:315-330(2002)

-1- FUNCTION: Nuclear hormone receptor. The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues.

CC r. SUBDINI: Binds DNA as a homodimer. Can form a heterodimer with ESR2. Interacts with NCOA3, NCOA5 and NCOA6 coactivators, leading to a strong increase of transcription of target genes (By Similarity). Binds UBEIC.

-1- SUBCELLULAR LOCATION: Nuclear.

-1- SUBCELLULAR LOCATION: Nuclear.

-1- DOMAIN: Composed of three domains: a modulating N-terminal domain.

-1- PTM: Phosphorylated by cyclin A/COR2 (By similarity).

-1- PTM: Phosphorylated by cyclin A/COR2 (By similarity).

-1- THIS PRELIANEOUS: In the absence of ligand, steroid hormone receptors are thought to be weakly associated with nuclear components;

-1- MISCELLANEOUS: In the absence of ligand, steroid hormone receptor receptor complex appears to recognize discrete DNA sequences

-1- SIMILARITY: Belongs to the nuclear hormone receptor family. NR3

Endocrinol. 104:163-172(1994).
PUNCTION: Nuclear hormone receptor. The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues (By similarity).
SUBBURIT: Binds DNA as a homodimer. Can form a heterodimer with BSR2. Interacts with NCOA3, NCOA5 and NCOA6 coactivators, leading

                     SUBCELLULAR LOCATION: Nuclear.

DOWAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain.

FIN: Phosphorylated by cyclin A/CDK2 (By similarity).

MISCELLANEOUS: In the absence of ligand, steroid hormone receptors are thought to be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor complex appears to recognize discrete DNA sequences upstream of transcriptional start sites.

SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
a strong increase of transcription of target genes. Binds UBEIC

                                                                                                                                                                     Ambitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.

Submitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.

- FUNCTION: Nuclear hormone receptor. The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues (By similarity).

- SUBUNIT: Binds DNA as a homodimer. Can form a heterodimer with ESR2. Interacts with NCOA3, NCOA5 and NCOA6 coactivators, leading to a strong increase of transcription of target genes. Binds UBEIC (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain. SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SEQUENCE OF 98-291 FROM N.A.

                                                                                                                                                                                                                                                                                                                                     (By similarity).
--- SUBCELJULAR LOCATION: Nuclear.
--- DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain.
--- SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HSSP; P03372; HGCP.

Jacobs E.C., Arnold A.P., Campagnoni A.T.;
Labra finch estrogen receptor CDNN: cloning and mRNA expression.";
I. Steroid Biochem. Mol. Biol. 59:135-145(1996).
I. FUNCTION: The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues.
-!- SUBUNIT: Binds DNA as a homodimer. Can form a heterodimer with BR-berea (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBCELLULAR LOCATION: Nuclear.

DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain.

SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          359 PGFVDLTLHDQVHLLECAWLEILMIGLVWRSMEHPGKLLFAPNLLLDRNQGKCVEGMVEI 418
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               121 FDMLLATSSRFRMMNLQG-EFVCLKSIILLNSGVYTFLSSTLKSLEEKDHIHRVLDKITD 179
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
  EMBO J. 5:891-897(1986).

-!- FUNCTION: The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues.

-!- SUBUNIT: Binds DNA as a homodimer. Can form a heterodimer with ER-
                                                                                                                                                         -:- SUBCELLULAR LOCATION: Nuclear.
-:- DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal seroid-binding domain.
-:- MISCELLANEOUS: In the absence of ligand, steroid-binding domain.
-:- Another to be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor omplex appears to recognize discrete DNA sequences upstream of transcriptional start sites.
-:- SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GO: GO: 0016585; C:chromatin remodeling complex; ISS.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 3, Ap

Patent No. 6235872

GENERAL INFORMATION:
APPLICANT: Bredesen, Dale E.
APPLICANT: Bredesen, Sharroz
TITLE OF INVENTION: Polypeptides and Methods of Use
MHER OF SEQUENCES: 72
ORRESPONDENCE ADDRESS:
ADDRESSEE: Campbell & Flores LLP
STREET: 4370 La Jolla Village Drive, Suite 700
CITY: San Diego
STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1; Indels

New mutant estrogen receptor ligand binding domain capable of interacting with non-endogenous ligand, useful e.g. in combination with a ligand for constructing selective molecular gene switches for regulating gene

Example 4; Page 117-118; 159pp; English.

The invention relates to a mutant osstrogen receptor (ER) alpha-ligand binding domain (LBD) which comprises an amino acid modification in region 1. region 2 or both and interacting with a non-endogenous ligand as a result of the amino acid modification. Sequences of the invention are useful for treatment of genetic diseases, acquired diseases and any other conditions including cell proliferative disorders such as cancer e.g.

are useful for the preparation of therapeutic agents for treating cancer, osteoporosis and other bone disorders, Alzheimer's disease and cardiovascular diseases

lung, breast, lymphoid, gastrointestinal, genito-urinary tract adenocarsionness and other malignancies such as colon cancers, renal-cell carcinoma, prostate cancer, non-small cell carcinoma of the lung, cancer of the small intestine and cancer of the oesophagus. The invention is useful for constructing selective molecular gene switches for regularing gene function in plants and transgenic animals. It is also useful in gene therapy. The present sequence is human ER alpha LBD -zinc finer array
                                                                                                                                                                                                                          181

The present invention relates to a human estrogen receptor (hER)-alpha isoform. Molecules which modulate the activity of the estrogen receptor

Page 45-46; 53pp; English

Claim 4;

```
The invention relates to a mutant oestrogen receptor (ER) alpha-ligand binding domain (LBD) which comprises an amino acid modification in region 1, region 2 or both and interacting with a non-andogenous ligand as a result of the amino acid modification. Sequences of the invention are useful for treatment of genetic diseases, acquired diseases and any other conditions including cell proliferative disorders such as cancer e.g. lung, breast, lymphoid, gastrointestinal, genito-urinary tract adenocarcinomas and other malignancies such as colon cancers, renal-call carcinoma, prostate cancer, non-small cell carcinoma of the lung, cancer of the small intestine and cancer of the osophagus. The invention is useful for constructing selective molecular gene switches for regulating therapy. The present sequence is human ER alpha LBD -zinc finer array (C7) fusion protein

                                                    The present invention relates to a human estrogen receptor (hER)-alpha isoform. Moleculas which modulate the activity of the estrogen receptor are useful for the preparation of theapeutic agents for treating cancer, esteoporosis and other bone disorders, Alzhaimer's disease and

                  The present invention describes a method for detecting the interaction of a first and a second protein within a mammalian cell. The method comprises a fusion protein of the first protein with two or more transcription activation sequences (which may be the same or different), and a fusion protein of the second protein with a DNA-binding sequence. These are expressed in a mammalian cell containing DNA carrying a reporter gene downstream of a sequence binding to the DNA-binding sequence; and the expression of the reporter gene is detected to indicate interaction of the two proteins. The method is useful for the identification and examination of protein interactions within the mammalian cell, and screening of potential drugs targeting them. The present sequence represents a hybrid protein from an example given in the
                                                                                                                                                                                                                                                               233
